Testing Results

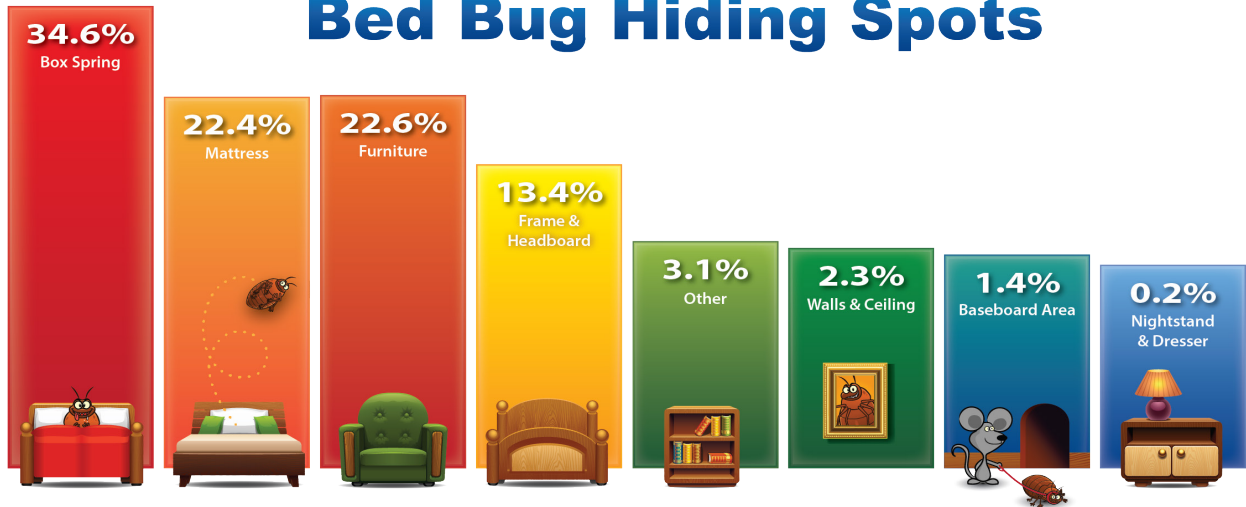

Effectiveness of Mattress Safe® Products in the Prevention of Bed Bug Damage

The fabric "feed through" method was used to evaluate if bed bugs (*Cimex lectularius*) could penetrate and feed through the fabric when a human host was present. The results prove that no bed bugs fed through the laminated fabric, the zipper enclosure, or the zipper seams during the evaluation. The zipper closure also prevented bed bugs from escaping during the study and prevented debris from passing through the zipper.
